Power cord for the United Kingdom

When using the instrument in the United Kingdom, make sure the power cord meets the following safety instructions.

NOTE: This lead/appliance must only be wired by competent persons

 **WARNING: THIS APPLIANCE MUST BE EARTHED**

IMPORTANT: The wires in this lead are coloured in accordance with the following code:

Green/ Yellow:	Earth
Blue:	Neutral
Brown:	Live (Phase)

As the colours of the wires in main leads may not correspond with the coloured marking identified in your plug/appliance, proceed as follows:

The wire which is coloured Green & Yellow must be connected to the Earth terminal marked with either the letter E, the earth symbol  or coloured Green/Green & Yellow.

The wire which is coloured Blue must be connected to the terminal which is marked with the letter N or coloured Blue or Black.

The wire which is coloured Brown must be connected to the terminal marked with the letter L or P or coloured Brown or Red.

If in doubt, consult the instructions provided with the equipment or contact the supplier.

This cable/appliance should be protected by a suitably rated and approved HBC mains fuse: refer to the rating information on the equipment and/or user instructions for details. As a guide, a cable of 0.75mm² should be protected by a 3A or 5A fuse. Larger conductors would normally require 13A types, depending on the connection method used.

Any exposed wiring from a cable, plug or connection that is engaged in a live socket is extremely hazardous. If a cable or plug is deemed hazardous, turn off the mains power and remove the cable, any fuses and fuse assemblies. All hazardous wiring must be immediately destroyed and replaced in accordance to the above standard.

Command Structure SCPI (Standard Commands for Programmable Instruments) commands follow a tree-like structure, organized into nodes. Each level of the command tree is a node. Each keyword in a SCPI command represents each node in the command tree. Each keyword (node) of a SCPI command is separated by a colon (:).

For example, the diagram below shows an SCPI sub-structure and a command example.

Command types There are a number of different instrument commands and queries. A command sends instructions or data to the unit and a query receives data or status information from the unit.

Command types

Simple A single command with/without a parameter

Example *RST

Query A query is a simple or compound command followed by a question mark (?). A parameter (data) is returned.

Example :CALCulate:CSO:STATe?

Compound Two or more commands on the same command line. Compound commands are separated with either a semi-colon (;) or a semi-colon and a colon (;:).

A semi-colon is used to join two related commands, with the caveat that the last command must begin at the last node of the first command.

A semi-colon and colon are used to combine two commands from different nodes.

Example :calc:ctb:stat on,result?

Command Forms Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case.

The commands can be written in capitals or lower-case, just so long as the short or long forms are complete. An incomplete command will not be recognized.

Below are examples of correctly written commands.

Long form	:CALCulate:ACPR:STATE?
	:calculate:acpr:state?
	:CALCULATE:ACPR:STATE?
Short form	:CALC:ACPR:STAT?
	:calc:acpr:stat?

Square Brackets Commands that contain square brackets indicate that the contents are optional. The function of the command is the same with or without the square bracketed items, as shown below.

Both “:OUTPut[:STATe]?” and “:OUTPut?” are both valid forms.

Note:

<digits> represents the data block length descriptor. Expressed as an integer number equal to the total number of <8 bit data bytes> that follows.

<nonzero digit> represents the number of digits that are part of the data block length descriptor.

Example:

#41202<8 bit data bytes>

4 digits will be part of the data block length descriptor and therefore 1202 <8 bit data bytes> will follow.

Status Registers

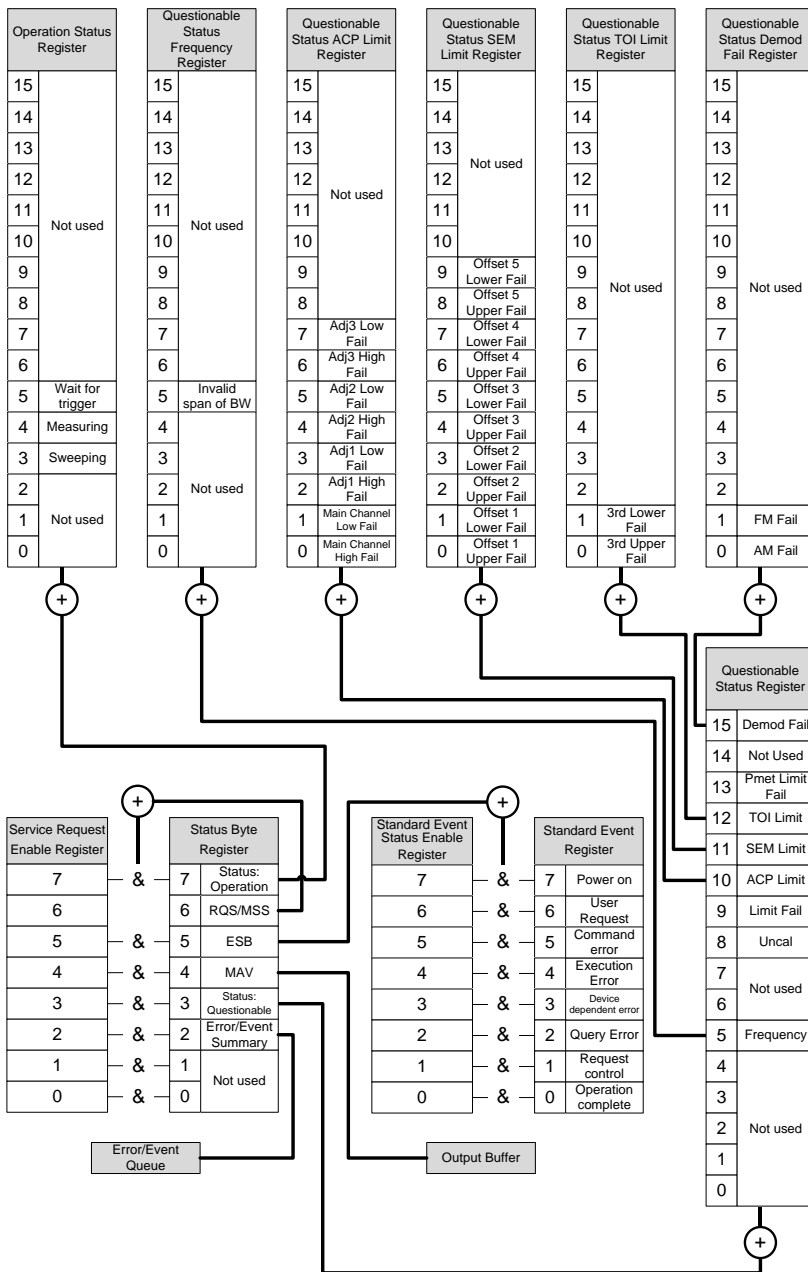

Status Registers Overview

Description

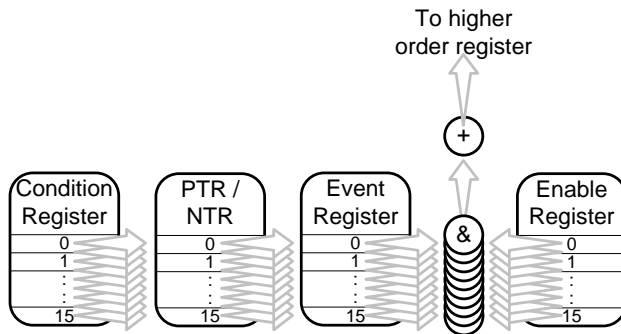

The status registers are used to determine the status of the spectrum analyzer. The status registers maintain the status of the pass/fail limits, trigger status and other operation statuses.

The status registers are arranged in a number of groups:

- *Questionable Status Registers*
- *Standard Event Status Registers*
- *Operation Status Registers*
- *Status Byte Register*
- *Service Request Enable Register*
- *Error/Event Queue*
- *Output Buffer*

Status Register Structure	<p>Each status register (excluding the status byte register) is divided into a number of register structures:</p> <ul style="list-style-type: none">• <i>Condition register</i>• <i>Positive transition register</i>• <i>Negative transition register</i>• <i>Event Register</i>• <i>Event Enable Register</i>
Condition Registers	<p>The condition registers report the state of the GSP-9300B. Condition registers can only be read.</p>
PTR Registers	<p>The positive transition registers are used to filter for events that occur from a negative to a positive transition.</p>
NTR Registers	<p>The negative transition registers are used to filter for events that occur from a positive to negative transition.</p>
Event Registers	<p>The PTR/NTP registers dictate the type transition conditions that will set the corresponding bits in the event registers. The event registers can only be read. Reading an event register will clear it.</p>
Event Enable Registers	<p>The event enable registers determine which events in the corresponding event registers will set the summary bits in a higher-order register.</p>

Status Byte Register (STB)

Overview

The Status Byte register consolidates the status events of all the status registers. The Status Byte register can be cleared with the *CLS command.

Any bits set in the Status byte register acts as a summary register for all the other status registers and indicates if there is a service request, an error in the Error Queue or data in the Output Queue. Reading the Status Byte register will reset the register to 0.

The Service Request Enable Register controls which bits in the Status Byte Register are able to generate service requests.

Bit Summary

Bit	Weight	Description
2	4	Error/Event Queue Summary bit: This bit is set when there is a message in the error queue.

Example	<pre>:TRAC? TRAC1 >-5.234e+01,-4.593e+01,-5.533e+01,-4.604e+01,- >5.353e+01,-4.557e+01,-5.280e+0 >1,-4.785e+01,-5.459e+01,-4.578e+01,.....</pre>	

:PIXel? TRACe<n> → Query

Description Returns the trace *pixel* data (real pixel value x100) for the selected trace in binary coded decimal format, represented by 2 characters per pixel (Highbyte_Lowbyte). Each trace has 601 pixels. In total, the query will return 1203 characters (601x2 + 1 EOF character). If you wish to determine the real value of a pixel simply divide the binary coded decimal character by 100. A binary coded decimal to ASCII lookup table is included in the Appendix on page 238.

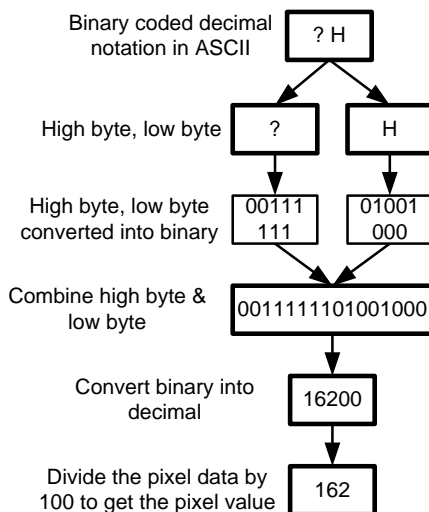

The pixel data that is returned is the y-axis pixel data for each nth pixel. The pixel data is taken from the display image data (450 x 600 pixels total).

Query Syntax	:PIXel? TRACe<n>	
Parameter	<n>	<NR1> trace 1~4
Return Parameter	<pixel data>	Pixel data. Returned as ASCII code in binary coded decimal format: #41202 pixel1#HbyteLbyte pixel2#HbyteLbyte pixel3#HbyteLbyte.....and so on until the EOF character

Example :PIXEL? TRACE1
>
#41202?H\x16\xA8\x16\xA8!\f|\xD4\x1E\x1E\xDC\xB4F\xB4%\x80%\xE4C\xF8E\$)\x04)hB\xCCC0.\x18-\xB4D\xC0E\xEC2d2dD\xC0E\xEC5\xE85\.....EOF

For example, data for the first pixel is returned as “?H”, the second as “\x”, the third as “16” and so on. Using the first pixel data as an example, the high byte is “?” and the low byte as “H”. To convert this data into a pixel value, follow the steps below:
